Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues in essence on page 9 "...even if the Office Action's assertion regarding reversing program direction were regarded to be tru (they are not), changing program execution 'direction' by jumpting back to a previous instruction as the Office Action describes is not the same as executing isntructions in reverse program order." This has not been found persuasive. The claim language in question states "a plurality of instructions stored in sequential positions of cache line in reverse program order." Based upon this language, the prior art needs to teach a cache that stores in sequential positions instructions from the program backwards order. For example, the instruction in location 1 comes after the instruction in location 2, and that is what unrolling loops does with their backwards branches does. When the loop branches backwards, the instruction instruction stored in the cache in the previous position comes before the instruction in the next position, since the backward branch causes instructions from locations prior to the current instruction to be stored. Applicants' arguments appear to insinuate there is more meaning to the phrase "reverse program order", but the Examiner could not locate a concise, deliberate meaning in the specification nor could she locate an appropriate, official definition in any technical dictionary. While the claims are read in light of the specification, limitations from the specification cannot be read into the claims.
